

ChatXPT

Viewer agency, generated live.

An AI stream director that turns gameplay context, audience energy, and streamer style into safe sidequests viewers choose in real time.

Knocked

02 · VOTE

Choose the chaos

01 Guardian Protocol **HARD**

Reach your knocked teammate and keep energy high until the mission finishes.

75s - 600 XP - The squad needs a rescue while chat is asking

col active - 600 XP

02 Caster Mode **EASY**

The creator gap is widening

OVERVIEW

A 2024-2025 regional Twitch audit shows why emerging creators need stronger participation mechanics, not simply more hours online.

75.23%

creator attrition

Creators present in the earlier cohort but absent in the later period.

90%

audience concentration

Share of audience attention held by the top 20% in the audited ecosystem.

-27.4%

average audience

Decline among creators active in both periods: 17.67 to 12.83 viewers.

Better gameplay alone is not enough.

Smaller streamers need repeatable moments that reveal personality and give viewers a reason to participate.

Evidence: Padilla, 2025 OSF preprint. Regional audit; not a global Twitch estimate.

Today's engagement is manual, shallow, and tiring to sustain

Livestream chat creates lots of messages but little structured participation.

Turning reactions into engaging content is inconvenient and mentally tiring because the streamer must read, interpret, moderate, invent, and operate controls while still playing.

Viewers comment, but rarely influence the next playable moment.

Generic polls ignore game state, audience mood, and streamer boundaries.

Problem statement: poor engagement plus manual conversion creates streamer burden.

ChatXPT removes the manual burden, one step at a time

PROBLEM		PROPOSED SOLUTION
01	Noisy or weak chat signals	> Separate gameplay, audience, and streamer-profile inputs become one usable context.
02	Streamer must invent engagement	> AI-ready intelligence produces exactly three distinct, vote-ready sidequests.
03	Manual prompts can be unsafe or disruptive	> Deterministic rules enforce safety, feasibility, timing, diversity, and veto boundaries.
04	Viewer input disappears into chat	> Twitch voting selects a winner; OBS shows it; progress and outcome return to the session.

Observe > understand > propose three > validate > vote > activate > resolve > learn

Solution mapping: each product mechanism resolves a stated burden from slide 3.

The MVP proves one complete path inside a larger product

OVERVIEW

FULL CHATXPT

Cross-platform AI stream director

- Persistent streamer and viewer profiles
- Multi-game intelligence and calibration
- Engagement analytics and adaptive timing
- Platform adapters and cross-stream history

TWITCH-FIRST MVP

What we prove now

- ChatXPT Studio + Twitch viewer surface
- OBS Browser Source overlay
- Gameplay, chat, and profile context
- Exactly-three algorithmic candidates
- Deterministic safety, voting, and lifecycle

DEFERRED, NOT DISGUISED

Non-Twitch adapters, public SDK/API, billing, monetary rewards, official telemetry partnerships, production-scale moderation, and public Extension review.

Scope evidence: implemented Twitch-first surfaces plus explicitly deferred expansion.

Twitch gives the MVP an interactive home without replacing OBS

USERS

Twitch supports panel, overlay, and video-component Extensions. ChatXPT can put voting beside the live video while OBS remains the broadcast tool.

01 First setup

Connect Twitch, select the capture source, add one ChatXPT Browser Source to the OBS scene, and save preferences.

02 Every later stream

Open the same OBS scene. Existing sources remain; ChatXPT observes and automation can open a vote when the chosen trigger is met.

ONE-TIME SETUP > OBS REMEMBERS THE SCENE > RETURNING STREAMS START FASTER

Evidence: Twitch supports Extension viewer surfaces; setup screenshot is local product evidence.

Streamers choose how much the system automates

USERS

AUTOMATIC

Set the trigger once.
Keep playing.

ChatXPT assesses silently, generates three quests, opens the viewer vote, and sends the winning quest to the overlay.

MANUAL

Review before viewers see it.

Analysis and generation still happen, but the streamer approves, rejects, or delays the vote.

Always available: emergency pause | skip/cancel/result | intensity | connection health | current context

Control principle: automation reduces work; it never removes streamer veto or safety authority.

Customise once; keep the streamer's personality in the loop

USERS

SAVED CREATOR INPUT

Game context	title/category, capability, phase
Performance style	tone, comedy, intensity, creativity
Boundaries	forbidden types, safety, accessibility
Intervention	automatic/manual, trigger, vote duration
Rewards	points, hype, result handling

ChatXPT should amplify the creator, not replace them.

Current MVP: Studio exposes the control model; authenticated profile persistence requires final integration proof.

Viewer agency turns watching into a shared decision

USERS

SEE THREE > VOTE > ACKNOWLEDGE > WATCH RESULT

Research on 2,227 Twitch users found that social interaction and sense of community help explain engagement, with stronger social motivations among viewers who preferred smaller channels.

The MVP therefore measures accepted-vote participation first. Belonging, retention, and return behaviour remain hypotheses to test, not claimed outcomes.

Primary KPI

Viewer participation rate

Research: Hilvert-Bruce et al., 2018; participation-at-scale study. Compact surface is fixture-only.

One interaction creates value across the livestream ecosystem

USERS

STREAMER

Turn a quiet or intense moment into a structured challenge without stopping to invent one.

Measure setup time, control burden, veto rate, completion.

VIEWER

Influence the next moment without leaving Twitch or creating a separate account.

Measure participation, vote completion, reconnect, reactions.

PLATFORM

Add differentiated, on-platform interactivity around existing live video.

Evaluate watch, follow, and support outcomes later.

RESEARCH-BACKED HYPOTHESIS

Live viewing can strengthen presence and connection; activated engagement is associated with virtual gifting. ChatXPT must still measure its own uplift before claiming retention or earnings impact.

Evidence: Duani, Barasch & Ward, 2026; Chokpisan et al., 2026. No guaranteed uplift claim.

OBS intelligence creates honest, confidence-scored AI context

MECHANISM

THREE INPUTS STAY DISTINCT

IMPLEMENTATION DECISIONS

- 01

Universal signals first
Broad activity and transition signals work across genres before game-specific HUD facts.
- 02

Calibrate only what is reliable
Selective OCR runs on bounded named regions; unsupported health, kill, score, or phase stays unknown.
- 03

Protect trust and privacy
Raw frames are ephemeral, carry provenance, and exclude the ChatXPT overlay to avoid recursive analysis.

AI assists context inference; uncertainty is a product state, not a reason to fabricate game facts.

Technical decisions: D-028, D-029, D-033, D-049, D-054.

The candidate layer is AI-ready and credential-free today

MECHANISM

MODEL-READY CONTEXT

EXACTLY THREE CANDIDATES

Judged MVP: credential-free algorithmic generator. External model provider not configured under D-055.

AI proposes; the deterministic quest engine decides

MECHANISM

DETERMINISTIC LIFECYCLE

Server time closes the 30-second vote. The engine resolves majority, ties, zero votes, points, hype, and allowed actions. Streamer auto/manual mode changes approval flow, never safety rules.

UIs display state. They do not calculate winners, rewards, or transitions.

Technical authority: pure deterministic engine; AI output is always validated before viewers or overlay.

One authoritative architecture keeps every surface consistent

MECHANISM

TECHNICAL RIGOUR

Versioned Zod contracts	Platform payloads and UI state stay outside neutral domain types.	Authoritative commands	Command IDs, permissions, expected revisions, idempotency, typed errors.
Consistent realtime	Server timestamps, atomic persistence before broadcast, reconnect snapshots.	Least privilege	Role-sanitised views, server-only secrets, read-only OBS output.
Integration evidence	Producer/consumer contract tests and explicit fixture/live labels.		

Evidence posture: automated checks prove contracts; real Twitch/OBS is required for live golden-workflow claims.

Future work: carry the stream director beyond one Twitch MVP

FUTURE

PROFILES + MEMORY

Persistent streamer personalities, boundaries, game preferences, cross-stream memory, and privacy-safe viewer profiles.

ANALYTICS + ADAPTATION

Quest timing, vetoes, completions, audience response, engagement experiments, adaptive styles, and highlight prompts.

GAMES + PLATFORMS

Calibration packs, official telemetry, evaluated AI providers, and adapters for YouTube, Discord, TikTok Live, Kick, and future APIs.

NEXT

Prove persistent profiles and engagement analytics on the Twitch workflow.

SCALE

Deepen game understanding and evaluate server-side AI against a recorded rubric.

EXPAND

Add platform adapters only after the complete Twitch path is proven.

Prove the interaction on Twitch. Carry the intelligence, safety, and participation engine everywhere streams already happen.

Roadmap only: non-Twitch adapters, richer analytics, profiles, telemetry, and external AI remain future work.
